REPORT OF THE FIFTH THULE EXPEDITION 1921–24
THE DANISH EXPEDITION TO ARCTIC NORTH AMERICA IN CHARGE OF KNUD RASMUSSEN, PH. D.
VOL. III. NO. 3.

# FIVE HUNDRED ESKIMO WORDS

## A COMPARATIVE VOCABULARY FROM GREENLAND AND CENTRAL ESKIMO DIALECTS

BY
KAJ BIRKET-SMITH

GYLDENDALSKE BOGHANDEL, NORDISK FORLAG
COPENHAGEN 1928

# I. Introduction.

## Nature of the Vocabulary.

THE Fifth Thule Expedition, which in the years 1921—24, under the leadership of Knud Rasmussen, visited Arctic America, had as its main object the study of the Eskimos from a folkloristic, an archæological, an ethnographical and, partly, also an anthropographic point of view, whereas the study of their language was, at first, not included in the program of the expedition. There was no one who had received any special linguistic training among the members of the scientific staff. In practice this did not put obstacles in the way of our work. Knud Rasmussen who from his infancy has been quite familiar with the Greenlanders' language and manner of thinking, was able to understand the dialects round Hudson Bay with the greatest ease; neither had the rest of us — in spite of our infinitely smaller knowledge of Greenlandic — any difficulty in our daily intercourse with the Canadian Eskimos, and as to more accurate investigations we received excellent assistance from the intelligent interpreter of the Expedition, the West-Greenlander Jacob Olsen.

We soon realized, however, that even though the linguistic work which we were able to do could never equal that of an expert, it would not be entirely without value when considering the extremely slight material otherwise available from the Central Eskimos. After having consulted with Knud Rasmussen, the present author determined to make an attempt at compiling a list of words from the chief dialects within our principal field of operation, and supplying it with comparative lists from West Greenland and the Thule District at Smith Sound. The assistance which I received from Knud Rasmussen throughout was an essential condition for carrying out the task appointed, and for this valuable assistance it is a pleasure as well as a duty to express my heartfelt thanks. Another faithful collaborator to whom I am greatly indebted is the above-

mentioned Jacob Olsen. To the late Professor Vilh. Thomsen I owe a special debt of gratitude for going over my manuscript and making a number of valuable comments; at the same time I must add that I am, of course, personally responsible for possible errors.

I realized from the start that in my linguistic studies chief importance should be attached to the phonetical side of the question, as my other tasks on the expedition and, not least, my limited knowledge of the Eskimo language made it impossible to compile a vocabulary of any considerable length. On the other hand, I thought that even a short list would be able to bring out rather clearly the most important peculiarities. A phonetician would naturally arrange his list with a view to his particular object. Unfortunately, I was not able to do this, because, if for no other reasons, the otherwise amble library of the expedition did not contain the necessary literature, linguistic investigations, as mentioned above, not being included in our tasks. I then determined to choose the words according to another principle. In his pioneering works Rink has shown to what extent ethnography may profit by the results of philology. When choosing by preference the names of such natural conditions and cultural elements as are closely connected with the Arctic existence of the Eskimos, I might hope to contribute towards elucidating the Eskimo culture from a linguistic point of view.

## Arrangement of the Material.

The chapter on pronunciation contains a more detailed account of the phonetic symbols used. Here attention will only be directed to the fact that wherever these symbols are used for rendering words in the text, they are placed within brackets. All other Eskimo words, and only those, are printed in italics. In such cases where it has been possible with certainty to transcribe the different spelling to the system followed here, a transcription has been undertaken; otherwise I have retained the orthography of the author in question.

The chapter on the Eskimo dialects partly supplies a few historical and geographical facts, partly a few remarks on their phonetic aspect. However, these remarks by no means make any pretence to completeness, as the present work is rather to be regarded as a presentation of the material collected.

In the various sections of the list the words are alphabetically arranged, except in such cases where this proceeding proved unpractical (relationship, pronouns, numerals). Whereas I do not think that the first sections of the list require further explanatory remarks, it will, I suppose, be necessary to say a few words about

the verbs. The transitive verbs are naturally quoted with a suffix and, as is natural and common, in the third person singular. Of the intransitive verbs some are, as far as the Central Eskimo dialects are concerned, quoted in the indicative, others in the noun participle. Perhaps under the influence of the teaching of grammar in the schools, in West Greenland a rather sharp distinction is made nowadays between these two forms, for instance [tikip·ɔq] he comes (indicative), [tikit·ɔq] one who comes, [tusarpara tikit·ɔq] I hear that he has come (participle). This does not apply in quite the same degree to the Central Eskimos who use the participle in many cases where the "correct" West Greenland usage requires the indicative[1]), this being due to the slight difference between the Eskimo noun and verb. In the list of words I have therefore made no attempt at normalizing the forms, but have used the one which I have heard in each individual case.

A number of notes are added to the list, partly relating to positive facts, and partly to linguistic matters. Without pretending to completeness I have attempted to explain deviating terms for the same idea from the meaning of the verbal stems. It is only natural that these notes should be based upon the West Greenland dialects, which are better known than any other. In exceptional cases where they have proved insufficient, other dialects have also been taken into consideration (Labrador, the Mackenzie Delta, North and South Alaska).

[1]) A somewhat similar fact also recurs farther towards the West. Uhlenbeck says (p. 58): "In het Mackenziedialect en meer naar het westen heeft het — i. e. the noun participle — den intransitieven indicativus verdrongen".

# II. Pronunciation.

## Phonetic System.

The system of symbols adopted in the compilation of the present list is very nearly the same as the one used by Thalbitzer in his works on Greenland phonetics, and thus also very nearly like the one employed by "l'Association phonétique internationale" [1]). As, however, I cannot claim to be regarded as anything but a layman in linguistics, I have, in certain particulars, simplified his alphabet, so as not to impart to my notes a higher degree of accuracy than I can venture to substantiate. On the other hand, it has proved necessary to introduce a few new symbols of sounds, which are unfamiliar to the Greenland Eskimo language. Everything considered, the Greenland and the Central Eskimo dialects are, however, extremely closely related, also from a phonetic point of view.

The modified system presents the following appearance:

| Consonants | Closed | | Fricative | | Nasal | Semi-vowels |
|---|---|---|---|---|---|---|
| | voiceless | voiced | voiceless | voiced | | |
| Bilabial | p | b ƀ | f | v | m | w |
| Dental | t c | d | s ʃ | z ʒ | n | j |
| Palatal | k | g ɟ | h x | ɣ | ŋ | — |
| Uvular | q | — | ʁ | r | q̃ r̃ | — |
| Lateral | — | — | ʟ | l | — | — |
| Glottal | ' | — | — | — | — | — |

[1]) Thalbitzer in "Handb. Amer. Lang.". p. 975.

| Vowels | Open | Semi-open | Semi-closed | | Closed | |
|---|---|---|---|---|---|---|
| | | | not rounded | rounded | not rounded | rounded |
| Normal ..... | a | ä | e | o | i | u |
| Uvularized ..... | ᴀ | — | ᴇ | ɔ | ɪ | — |
| Nasalized ..... | ã | — | ẽ | ɔ̃ | ĩ | — |

An exponent after one of the common symbols denotes a faint glide towards the sound of the exponent or a very faintly articulated and, therefore, hardly audible sound, for instance $u^w$, $t^s$.

As regards the pronunciation the following particulars must also be given, the reader being at the same time requested to bear in mind that the comparisons with the sounds of known, European languages can naturally only be approximate, although the Eskimo sounds in many cases are very close to the European ones.[1])

a: as in French "aller"; au and ai are always diphthongs, as in English "how", "high". In modern West Greenlandic a complete assimilation of the u and i sounds has frequently taken place, a long a being the result. In the other dialects the diphthongs, on the other hand, are common. In the Thule District and at Kazan River au an ai sometimes approach öu and äi.[2])

ᴀ: the uvularized sound corresponding with a, as in English "far".

ã: nasalized ᴀ; occurs only before r, combined with a nasal consonant.

ä: most frequently as in English "hat"; at times somewhat more closed, as in French "lait".

b: a sound which does not occur in modern West Greenlandic. I think I have heard it in some cases as a true, voiced sound (media), perhaps as in English, hardly as marked as in French. Most frequently, however, b seems half-voiced as the Danish b, but it is always a sound which is clearly distinct from p.

ƀ: labialized sound between b and v; principally occurs before v and not in modern West Greenlandic.

c: at first I had not used this sign in my notes. In the cases where the sound combination $t^s$ occurs in West Greenlandic I had, for the dialects of Simpson Peninsula and Kazan River, $t^s$ or $t^l$, in some cases even $t^h$. However, it seemed to me that the sound

[1]) Ibid. pp. 975 sqq.

[2]) On the other hand, I have not heard au pronounced as äu; the occurrence of this diphthong is maintained by Stein.

was in reality more uniform than indicated by these symbols. Since then I have read Thalbitzer's description of the phonetics of the East Greenland dialects, which had not been published at that time. Here mention is made of a sound, expressed by the sign c — "c (unvoiced, mouillé) is a mingling of a palatal t and s, at the same time post-dental and prepalatal."[1] I have now no doubt that it is this sound I have heard, and therefore I have not hesitated to introduce the symbol c for the dialects mentioned above. Melville Peninsula, however, seems to have an actual $t^s$ as in West Greenland. As to the Thule District I have retained the writing $t^s$, although the s is frequently almost inaudible, and the sound strongly approaches the northern West Greenland t·.

ɔ: see after o.

d: half-voiced, more rarely voiced sound; unknown in modern West Greenlandic. Cf. above under b.

e: as in French "été".

ɛ: "uvalarized" sound, corresponding to e, viz. an e which, under the influence of a succeeding uvular sound, is articulated farther back in the mouth than e pure.

ɛ̃: nasalized ɛ; occurs in similar combinations as ã.

f: bilabial sound, very different from the English and French labiodental f. Only in West Greenland is the labiodental f gaining ground probably owing to Danish influence.[2]

g: as in English "begin", French "gant". This sound, which does not occur in modern West Greenlandic, is far more rarely half-voiced than b and d.

ɣ: a voiced, "open" g, corresponding to the unvoiced x, as in (North) German "regen", Danish "age", Russian "когда".

ɟ: palatalized g; unknown in modern West Greenlandic.

h: only in a minority of cases — apart from the Kazan River dialect — the simple expiration as in English and Danish. As a rule it is pronounced with the posterior or middle part of the tongue slightly raised, thus becoming an intermediate sound between (English) h and x, or between (English) h and ʃ. It is one of the most difficult sounds to define, and in many cases — still apart from Kazan River — it seems to depend upon individual inclination whether h, x or ʃ prevail. This is particularly marked in the Thule District where the h-sound is now slowly beginning to disappear under the influence of immigrators from West Greenland. Here h is practically unknown.

[1]) Thalbitzer: Lang. and Folkl., p. 121.

[2]) Thalbitzer: Phon. Study, p. 103.

i: as in French "ici".

ɪ: "uvularized" i (cf. E), suggesting the Russian ы; in all probability not occurring in West Greenland.

ĩ: nasalized ɪ: occurs in the same combinations as ã and ẽ.

j: as English y in "yard", German and Danish j. In the Central dialects there is sometimes an approach to ʒ.

k: as French c in "cas"; especially in front of a, o and ɔ very faintly aspirated[1]) and thus different from the corresponding Germanic sound.

l: as in French "aller", but very different from the "hollow" English l in "always" and from the Russian л. Sometimes it seems to be preceded by a very faint d-sound.

L: unvoiced l.

m: as in English "man".

n: as in English "no".

ŋ: as ng in English "song".

o: as French "eau".

ɔ: the uvularized sound, corresponding to o.

ɔ̃: nasalized ɔ; occurs in the same combinations as ã, ẽ and ĩ.

p: as French p; aspiration as in the case of k.

q: uvular k, in the standard Greenlandic orthography indicated by the sign K.

q̃: the nasalized consonant corresponding to q; rare in West Greenland, but extremely common on Melville Peninsula.

r: a uvular, untrilled r as in Danish and North German, but very different both from the English point r, and the Parisian trilled (rolled) r. In the Thule District the intervocalic r may be to some extent labialized, so as almost to approach w; this also appears from the — for that matter very unreliable — rendering of Polar Eskimo words by English-speaking authors.

R: voiceless r, almost as ch in German "ach", Scotch "loch".

r̃: nasalized r; only occurs between a vowel and m, n or ŋ.

s: voiceless point s, as in English "sing". Parry writes: "The letters *r* and *s* are never pronounced as with us, but in a thick, guttural manner, the former approximating to the Northumbrian dialect, and the latter to the Scotch *ch* (as in the word: loch)".[2]) The latter comparaison is hardly correct, but may suggest a sound somewhat like ʃ. Parry's list of words is from Aivilik and Iglulik. In the former district both s and ʃ occur, in the latter now hardly any other voiceless sound than s (judging from the quite few Iglulik Eskimos I must own I have heard), but on the

[1]) Thalbitzer: Phonet. Stud., p. 71.

[2]) Parry, p. 553.

other hand the voiced z. Should Parry's statements then be taken as evidence of a modified pronunciation?

ʃ: a voiceless palatalized sound the formation of which Thalbitzer describes in the following manner: "The point of the tongue rests passive against the back of the lower teeth, and the middle (and back?) of the tongue is somewhat raised. The groove stretches over a large portion of the surface of the front of the tongue".[1]) The sound in all probability is somewhat reminiscent of the Russian palatalized c, for instance in "севя". It is, at any rate, rather different from English sh, with which it is sometimes compared. On the other hand, it may now and then rather approach ʟ. In West Greenland a faint i-sound sometimes seems to be heard before ʃ, that is [i]ʃ.[2]) However the ʃ-sound is on the point of disappearing in favour of s, in the same manner as bilabial f is disappearing in favour of labiodental f. In this list s has been employed everywhere as far as West Greenland is concerned, although my informant frequently used ʃ in connected speech.

t: dental as in French "été"; faintly aspirated in the same cases as k and p. A characteristic and common combination of sounds is $t^s$ (cf. the above under c). In this, as in the Russian ц, the two elements are closely joined and together take no longer than a single consonant.

u: as in German and Danish u, French ou.

v: bilabial v, as Spanish b in "Habana"; like the bilabial f in West Greenland on the point of disappearing in favour of the labiodental v.

w: at Kazan River as English w, otherwise slightly less rounded.

x: the voiceless sound, corresponding to g; as German ch in "ich" or Russian palatalized x.

z: semi-voiced, more rarely voiced, palatalized sound, corresponding to ʃ; very different from English z in zeal, rather as Russian palatalized з.

ʒ: the same sound as z, but with what the Germans call "Rauschlaut". It sounds almost between Danish j (English y) and French j, though it more nearly approaches the former. After g it is sometimes so faintly pronounced that it is almost on the point of coalescing into one sound, a long palatalized ɕ.

ʾ: glottal stop, quite as in Danish "Kam", "gul". At Kazan River and, slightly less marked, in Committee Bay it is a common and characteristic phonetic component of the language.

[1]) Thalbitzer: Phon. Stud., p. 89. — Cf. Stein, p. 198.
[2]) Cf., however, Thalbitzer: Phon. Stud., p. 89.

## Dynamics.

The length of a sound is expressed by · after the sign in question, for instance a·, k·; in the Eskimo language the quantity of the sounds plays a far greater part than in most Indo-European languages. Thalbitzer's remark "a long vowel or consonant in English, French etc. is of a shorter duration than the corresponding sound in Greenlandic"[1] also applies to the Central Eskimo dialects. In these we may also meet the same four combinations of long and short sounds. It is most difficult to determine the length of the voiceless fricatives, because they are always, even when short, of somewhat longer duration than the other short consonants.[2] Therefore, in the list errors in writing down these sounds may have been committed.

As contrasted with the length of sounds the stress is of less importance than in English and other Germanic languages, and therefore it has only been indicated in the list in exceptional cases, viz. by ˈ before the sound in question, for instance ˈa. The remarks made by Thalbitzer may be quoted as a main rule: "The dynamic accent in a great many words is uncertain or only slightly differentiated . . . There is always a marked stress on the vowel before a long (geminated) consonant, or on a long vowel . . . Besides, the final syllable has a tendency to attract the stress to itself".[3]

The movement of speech is, as a rule, rather slow. The musical accent varies greatly from one dialect to another.

## Remarks on Eskimo and Indian Sound Systems.

The Indo-European languages are so well known from a phonetic point of view that it would be presumptuous on my part to undertake a comparison between their sound systems and those of the Eskimo language. Besides the two linguistic stocks in question have had such a slight connection with each other outside Greenland — where a certain influence, as mentioned above, really can be traced — that a comparison would hardly offer many points of interest at the present stage of the linguistic study. This is presumably different in the case of the adjoining Indian languages, which, for one thing, are less known phonetically, and which have had an opportunity of influencing the language of the Eskimos for untold centuries.

[1]) Cf. Thalbitzer: Phon. Stud., p. 125.
[2]) Ibid. p. 120.
[3]) Thalbitzer: in "Handb. Amer. Lang.", p. 982.

On Newfoundland the Eskimos met the now extinct Beothuk, in Southern Alaska they now live beside the Tlingit, and in Siberia the Chukchi are their immediate neighbours. The only two linguistic groups which are, to any great extent, conterminous with the Eskimos are, however, the Algonkians towards the east and the Athapascans towards the west.

In Labrador the Eskimos border on the Algonkian tribes Montagnais, Naskapi and Cree, and even though the latter tribe is now, to the west of Hudson Bay, cut off from the Eskimos by the Athapascan Chipewyans (Caribou Eaters), before the penetration of the latter from the Mackenzie region there has been a connection between Eskimos and Cree. The only Algonkian language I have heard is the Cree. Unfortunately I have no notes about it, but I think that I may venture to maintain that its sound system with its very easy — also for us Europeans — and, as it seem, comparatively few sounds is widely different from the Eskimo.

The one of the two Indian stocks with which the Eskimos west of Hudson Bay are in direct contact is the Athapascan. As far as the Western Eskimos are concerned it is a question of the Kutchin, Khotana and Ahtena tribes, whereas for the Central Eskimos it is the Chipewyans and the closely related tribes Yellow Knives (Tatsanotinne) and Dog-Ribs (Thlingchadinne). At Churchill I have frequently had the opportunity of hearing the Chipewyan (Caribou Eaters') dialect, and I have made a number of notes regarding it, upon which the following remarks are based.

In comparison with the Eskimo consonants the Chipewyans, in the first place, lack some bilabial sounds, viz. p, f and v. On the other hand, they have two interdental sounds, a voiceless as in English "think", and a voiced as in English "that", the former especially being one of the most common sounds. The very characteristic palatalized Eskimo consonants are entirely unknown to the Chipewyans, who in addition to the common dental s have the corresponding voiced sound, and further a consonant like the English sh, which is sometimes voiced like French j; finally, besides the common dental t, they have a very strongly aspirated dental t, a palatal (?) t and the corresponding strongly aspirated sound, a common k and a strongly aspirated k.[1]) The Chipewyans, on the other hand, lack the characteristic uvular sounds q and q̃.

If we turn to the vowels, we shall find that with the Chipewyans the list is extended by a sound as in English "law", another as in

[1]) The Chipewyans regard tenues and the corresponding media as the same sounds. One may hear the same person pronounce the same word, sometimes with voiceless, sometimes with voiced consonants.

French "seul", an unstressed vowel as in the first syllable of English "to-day" [ə] and, finally, a far more extensive use of the vowel in French "lait" than is found in the Eskimo language, whereas the one resembling it, viz. that in English "hat", presumably does not occur. On the other hand, we naturally lack all the Eskimo uvularized vowels. Among the Chipewyans, the nasal vowels play a similar part to the one played by the uvularized vowels among the Eskimos, all Chipewyans vowels being frequently nasalized with the exception of u (?) and ə.

Of more "characteristic" sounds only x, g, ʁ, r and ʟ are in reality common to both lauguages. A glottal stop is mentioned by Goddard as occuring with the Chipewyans at Cold Lake.[1]) I am fairly certain that anything resembling the Danish glottal stop does not occur in the Churchill dialect, except perhaps initially (spiritus lenis), as I could hardly have failed to catch such a characteristic and homelike sound.

The peculiar and, to our ears, by no means beautiful character of the language of the Chipewyans is due to the nasal vowels, the interdental fricatives, and the strongly aspirated tenues, in the same manner as the Eskimo language is distinguished by the uvular, and partly also by the palatalized consonants and uvularized vowels. Generally speaking the phonetics of the two languages must be said to be so far removed from each other that any larger mutual influence is outside the bounds of probability.

As to the possibility that the unvoiced l [ʟ] has been adopted into the Eskimo language from foreign sources, see p. 32.

[1]) Goddard, p. 6.

# III. The Dialects.

## Grouping and Mutual Similarity.

There is a possibility that the four words which are preserved, through the saga of Erik the Red, from the "Skrælings" on Markland are of Eskimo origin.[1]) If so, this is the oldest known specimen of the Eskimo language, or more acurately defined, the dialect on the Atlantic coast of Labrador. It was, however, not until the north-west expeditions of the Renaissance period that indubitable Eskimo words were written down, there being a short list of seventeen words dating from Frobisher's visit to Baffin Land in 1576. Ten years later, the first actual list of words was compiled, being of double the length as the one mentioned above, from West Greenland, and it was Davis, who in this modest way laid the foundation of the later thorough study of the language of Greenland. Thus Europe obtained, at a very early period, a superficial knowledge at any rate of two of the branches into which the East Eskimo dialects are divided, viz. the Greenland and the Central branch. As mentioned above, the very oldest information possibly dates from the third and last, the Labrador branch.

This geographical division into a Greenlandic, a Central and a Labrador branch of dialects, is practical, but probably of no great linguistic value. For irrespeetive of these branches the dialects form groups, the mutual relation of which only in part corresponds with the geographical division. The West Greenland group is rather close to the Iglulik group, which belongs to the Central branch, the latter in its turn being very close to the Labrador group. On the other hand, the difference, for instance between the Pâdlimiut and the Iglulik dialects, is far greater than between the Iglulik and the Labrador dialects.

One thing must be borne in mind which, however, will fully appear from the list, viz. that even between the dialects mutually

[1]) Thalbitzer: Skræl. i Markl. og Vinl., p. 350.

most removed the differences are only small. It is true that they are somewhat greater than between English and American-English or between Danish and Norwegian "riksmål", but they are less than between Danish and Swedish. The difference between the individual groups may, perhaps, be compared with the difference between standard English and Scotch, and between standard Danish and Jutlandic. A similar amount of practice to that which is needed by an Englishman in order to read Robert Burns, or by a Dane in order to enjoy Blicher, is all a Greenlander requires in order to understand the central dialects. Neither Jacob Olsen, a native of West Greenland, nor our Polar Eskimos had spent many days among the Canadian Eskimos, before they were able to talk freely with them upon all everyday subjects.

## Greenland Dialects.

Within the confines of Greenland there are three groups of dialects which belong, respectively, to the east coast, the west coast south of Melville Bay, and the Thule or Cape York District at Smith Sound.

The most easterly of these — in fact the most easterly of all the Eskimo groups — only comprises the southern part of the east coast of Greenland, from Blosseville Coast to Cape Farewell. It is true that as late as at the beginning of the 19th century the Eskimo language was spoken much farther north, viz. on Clavering Island, between lat. 74—75° N, where in 1823 Clavering met a family of twelve members, including women and children. However, the inhabitants of the north-east coast were entirely extinct, before the next expedition visited these remote parts, and nothing whatsoever is known of their language. Thalbitzer defines the distribution of the three southern dialects in the following manner:[1])

Lat. 68°—64° N. Kialineq (Kialêq)—Pikiutdleq (Pikîteq): the Angmagssalik District.
„ 64°—62° N. Umîvik—Ikermiut (Ikermîn) } Frederik VI
„ 62°—60° N. Anoritôq (Anoritêq)—Aluk (Alik) } Coast.

The only vocabulary to hand from the east coast was for a long time the brief list, published by Rink, and based upon the notes made by the Holm Expedition. Since then the Angmagssalik dialect has been subjected to exhaustive studies by Thalbitzer, whose results, however, have only been published in parts. In 1923

[1]) Thalbitzer: Lang. and Folkl., p. 152.

it was spoken by 709 individuals. From Frederik VI Coast very little is known apart from a list of words and a text published by the Rev. Poul Vibæk, and as the inhabitants of the whole of this region have gradually immigrated to the southern west coast in the course of the 19th century, their linguistic peculiarities have probably now entirely, or almost entirely, disappeared. As the East Greenlands dialects are not included in the present work, no particulars regarding them will be given. —

On the whole of the long west coast which, irrespective of the indentations, corresponds with the distances between Copenhagen and Naples or from Niagara halfway into Florida, four principal dialects are spoken, which, however, are very closely related. Even the oldest vocabulary from these parts, viz. the above-mentioned work of Davis, brings out a point of considerable interest. Davis translates "a fogge" by *tucktodo*[1]), whereas "fog" in West Greenland is now called [pujɔq]. At the present time it is not till Iglulik that the word [taktuɳ] is again met with — at Kazan River [takxEq] — with the same meaning. The word is derived from [tA·q], darkness.

Whereas Davis' list was written down in far too inadequate a manner to be of value from a phonetic point of view, this, in spite of all deficiencies, does not apply to the two succeding compilations, viz. those made by Olearius and Caspar Bartholin, both of them originating from the Greenlanders who in 1654 were carried from Godthaab Fjord to Denmark by the Danell Expedition. These lists and, in a much higher degree, the later, far more complete dictionaries compiled by Poul Egede and Fabricius fully show that the pronunciation in West Greenland has altered on certain points during the last centuries. The interesting feature is that the old forms show a far greater resemblence to the Central Eskimo pronunciation than do those of the present day. In modern West Greenlandic an assimilation has taken place in the first sounds within certain consonant groups, whereas in former times they were evidently pronounced separately, as is still the case in the Thule District and within the Central Eskimo area. Instead of the modern forms [umiʃ·uit], large beard, [iʟ·ät·ut], those (who) laugh, [tut·o], caribou, Olearius and Bartholin give the forms *umixuin, iglakton, tucto,* which clearly indicate the pronunciation of the consonants.[2]) Even a comparatively modern author like Fabricius writes the words in a manner which points in the same direction,

[1]) Davis, p. 21.
[2]) Olearius, p. 86. — Bartholin, p. 76.

for instance, *túkto.*[1]) The writing of a mute g (corresponding to the k and c of older authors) has been retained in the Greenlandic orthography. There is evidently some connection between the assimilation of the initial consonant and the change from voiced to voiceless which seems to have taken place in these cases, as for instance *ublau*, day, now [uʟ·ɔq]; *ibling*, thou, now [iʟ·it]; *ipgin*, straw, now [if·it].[2]) Fabricius has these words as *údlok* (but *kablunâk*, a European) *iblit* or *ivlit*, as well as *igvit*.[3]).

An assimilation of consonants which was demonstrated by Thalbitzer[4]) is the disappearance of r before s, for instance [iʃe], eye, written *irse* by Egede.

Another change applies to the final consonants which in the 17th century seem to have been nasalized in a much higher degree than at present. Instead of the present q, k and t, the old lists have spellings which suggest the pronunciation q̃, ŋ and n. Here a few examples:

| Olearius and Bartholin.[5]) | Modern Forms. |
|---|---|
| *canagtong* [qẽr̃nertɔq̃], black. | [qẽr̃nertɔq] |
| *cachslutong* [qe·rlutɔq̃], wild duck. | [qe·rlutɔq] |
| *okang* [ɔqaq̃], tongue. | [ɔqaq] |
| *pauting* [pautiŋ], kayak paddle. | [pa·tik] |
| *capiffiling* [kapisiliŋ], salmon. | [kapisilik] |
| *apon* [apun], snow. | [aput] |
| *invin* [inuin], human beings. | [inuit]. |
| *iglun* [iglun], houses or your house. | [iʟ·ut]. |

Olearius adds: "Es sind viel Wörter / sonderlich die das (n) bey sich haben / die sie durch die Nase reden / und nicht so wohl können geschrieben werden".[6]) According to Hans Egede the nasal final consonants particularly occurred among the women.[7]) The old authors also have m as a relative ending instead of the modern p. Thus, Hans Egede writes *Nallekam okausia*, the Lord's prayer, whereas it is now [na·lăk·ăp ɔqa·sia]. As early as in Fabricius' works these nasals are replaced throughout by the modern tenues, and at the present time they only occur in certain instances where the final consonant is affected by the following word, for instance [kikun·uko],

[1]) Fabricius, p. 504.

who are they, compared with [kikut], who, with a normal plural. Also, according to Jacob Olsen, the Greenlanders round Sukkertoppen to a very great extent still use ŋ, n and m as final consonants instead of k, t and p.

The words quoted above show a further difference between older and modern West Greenlandic, viz. as regards voiced and voiceless consonants: [qĔr̃nᴇʀtɔq̃], [qᴇ·ʀlutɔq̃] with the voiceless ʀ, where in modern times r is used. The same pronunciation is shown by a form *pilachtagtong* [piläxtaʀtɔq̃], he (who) flenses[1]), as contrasted with the modern [pilät·artɔq]. Here Fabricius has *kernektok, kærtlutôk* and *pilléktorpok*[2]). Bartholin's *ochac*, blubber, even reminds us of the Pâdlimiut form [ɔqʀɔq], Fabricius *orfok*, modern West Greenlandic [ɔrʃɔq][3]).

Finally, the disappearance of the diphthongs should be mentioned as the last change in the pronunciation. However, in West Greenland the diphthongs *au* and *ai* (*ao* and *ae*) are still written, while the younger generation now only pronounce a long a; even Thalbitzer in his work from the journey of 1900—01 writes these diphthongs as $a^u$ and $a^i$, and in some localities at any rate, for instance at Jakobshavn, they seem within living memory to have been pronounced still more distinctly.

The modern West Greenland dialects, which are spoken by 13,847 individuals all told (1923), have particularly been studied by Thalbitzer, and while referring the reader to the work of this author I shall limit myself to a few remarks. We are able to distinguish between at least four dialects, although it is rather difficult to define them closely. There are gradual transitions, as some peculiarities of pronunciation seem to have spread beyond the confines of the dialects, where they must rather be supposed to belong. As I think I have proved on an earlier occasion[4]), the southern dialect, at the time of Hans Egede, did not extend beyond Julianehaab Bay, while its influence is now to be traced all the way to Godthaab. This is chiefly due to the Moravian missionaries who induced several southerners to settle near Godthaab, when they passed through this district on their trading journeys. The four main dialects roughly comprise the following areas:

lat. 60°—61° N. the Julianehaab District.
„ 61°—67° - „ Frederikshaab-Holsteinsborg Districts.
„ 67°—72° - „ Egedesminde-Ũmánaq Districts.
„ 72°—74° - „ Upernivik District.

[1]) Bartholin, p. 75.
[2]) Fabricius, pp. 195, 239, 365.
[3]) Ibidem, p. 336.
[4]) Birket-Smith: K. Farvel-Distr. Kulturhist., p. 30.

The Julianehaab dialect shows a connection with the language of the east coast in several respects, not merely in the vocabulary, but also phonetically. The most striking feature is that the vowels i, e, ɛ in many cases, as further east, replace the rounded u, o, ɔ, for instance [marlik], two, [ajiŋ·ilaq], good. In the most southerly part of the district ŋ is frequently used instead of g. The latter sound has perhaps penetrated from the north, where ŋ is unknown in the corresponding combinations.

The dialect spoken north of this district, and which comprises the west coast as far as the Arctic circle, has formed the foundation of the written Greenlandic language. As contrasted with the Julianehaab dialect it is characterized by the rounded vowels u, o, ɔ as well as by g, instead of ŋ. As contrasted with that of the Egedesminde-Ũmánaq area the sound-combination $t^s$ is common. Instead of ʃ a peculiar sound occurs which, from the specimens given to me by Jacob Olsen, must rather be characterized as a cacuminal point-s, which harmonizes with the observation of Thalbitzer[1]). As already mentioned, the nasal final consonants ŋ, n, m are said to be retained in the Sukkertoppen District.

In the Egedesminde-Ũmánaq dialect ŋ is extremely common instead of g. The latter sound is — as far as my experience goes — almost unknown in Egedesminde, but sometimes occurs at Disko Bay and in the Ũmánaq District. In addition a long t is frequently used instead of $t^s$, and rŋ instead of rn. In the Ũmánaq District q̃ sometimes replaces r, which is probably owing to influence from the north. It is the Ritenbenk dialect which forms the base of the present list.

In respect to the Upernivik dialect Thalbitzer has undertaken a thorough research, with the result that it has been proved to lack the common sounds ʁ, x, g, f. Instead of the long voiceless fricatives q·, k·, p· are used, and r, v, $t^s$ are frequently replaced by q̃, ŋ, s and sometimes u by i. —

The third and last group of dialects in Greenland only comprises a single dialect, spoked by the Polar Eskimos in the Thule District, a small tribe of 251 individuals (1923), who inhabit the country from the northern part of Melville Bay to Humboldt Glacier. Their dialect is very little known, although a short and, it is true, rather incorrect list of words was given as early as by John Ross, the discoverer of the tribe. A mistake which occurs throughout this list is the placing of h before words beginning with a vowel as for instance *hemuck* [imɛq], water, *haphuck* [arfɛq], bowhead whale. Since then Kroeber, in his description of

[1]) Thalbitzer: Phon. Study, p. 90.

the ethnography of these Eskimos, has given a number of words, his list of conjurors' terms being particularly valuable. There is the peculiarity about Kroeber's list that it seems to show a strong influence from Baffin Land. This may possibly be due to the influence of Boas' famous work "The Central Eskimos", but may also be due to the immigration which took place from Baffin Land to the Thule District in the sixties of last century. The geologist Stein in his treatise on geographical names among the Polar Eskimos gives a number of phonetical data, but he also makes remarks which suggest an influence from the other side of Baffin Bay (the presenze of z and q̃, the frequent use of nasal final consonants, etc.).

The vocabulary of the Thule dialect deviates in many ways from that of West Greenland, and phonetically this dialect represents a more old-fashioned stage. The far-reaching assimilation of consonantal groups and diphthongs has not yet taken place, and this evidently has some bearing upon the preservation of the voiced consonants b, d, g, for instance [täblo], chin; [udlᴀ·q], morning; [iglᴇq], sleeping platform. Other voiced sounds, which occur in West Greenland, are here sometimes used in different combinations, thus [sᴇrva], guillemot; [tiggäk], stinking fjord seal.

It is of the greatest interest to find faint traces in this dialect of the course of the metathesis, which Thalbitzer demonstrated among the East Greenlanders, forms like [upᴇʳŋgᴀ·q], spring, [ã·ʳŋguᴀq], amulet, being met with. On the other hand, the rdl-forms are already fully developed: [mᴀrdluk], two; [pᴇrdlᴀ·q], sledge shoe; the same applies to [mᴇrqut], needle. The corresponding retrogressive labialization, which has taken place in West Greenland, but not in Labrador, is also found at Thule, for instance [iblit], thou. This is a sound-development which closely connects the Thule dialect with the other Greenland dialects and distinguishes it from the Central Eskimo and Labrador ones.

Also as regards the s-sounds, the dialect seems to be most closely related to West Greenlandic. The dental s, however, rarely occurs, but in most cases it is replaced by ʃ or h. After k the latter sound is pronounced with the back part of the tongue so greatly raised that it becomes x, for instance [ikpakxᴀq], yesterday. On the other hand j is presumably not used instead of s, as believed by Thalbitzer[1]). Nasal final consonants occur, but they are not so common as the corresponding tenues. In the above I have suggested a possible explanation of their frequent use in earlier

[1]) Thalbitzer: Phon. Study, p. 200.

works. It is hardly the language which has changed, for one of my native informants must have been about sixteen years of age, when Stein wrote his treatise.

One thing which makes the investigation of the Thule dialect so extremely difficult is the slurred, vaguely articulated manner of speaking, by which a number of sounds, especially the final consonants, are sometimes entirely swallowed. Thus in daily speech [qɛqɛrtarhuk], island, sounds rather like [qɛqᴱrtAʳʰuᵏ]. A q at the end of a word is not infrequently weakened to r, while r between two vowels is labialized to resemble w.

## Central Dialects.

It is apparently possible to divide the Central Eskimo dialects into five groups, which may be termed the Cumberland Sound, the Iglulik, the Netsilik, the Coronation Gulf, and the Barren Grounds groups.[1] Like the Thule dialect, they are all characterized by the non-assimilated consonant-groups and diphthongs, but otherwise the mutual differences between them are rather considerable.

The Cumberland Sound group belongs to southern Baffin Land and is spoken by the Eskimos inhabiting the northern coast of Hudson Strait, Frobisher Bay, Cumberland Sound and Home Bay. Frobisher's list of words, which is the oldest incontestable information relating to the history of the Eskimo language, originates from these tribes, and as pointed out by Thalbitzer even this early list is of considerable interest from a phonetic point of view. Owing to Boas' vocabulary and texts, the Oqomiut dialect at Cumberland Sound has long been the best known Central Eskimo dialect. However, we are not going to enter into the details of this dialect, as the whole group falls outside the sphere of activity of the Fifth Thule Expedition. —

To the Iglulik group belong three different tribes, the Tununermiut, the Iglulingmiut [iglu'liŋmiut] and the Aivilingmiut [aivi'liŋmiut] which together, according to the census taken by Therkel Mathiassen, amount to 499 individuals. The Tununermiut have their home at Ponds Inlet, from where they sometimes extend their hunting area both to North Devon and Admiralty Inlet.[2] It is from this tribe that an immigration into the Thule District took place in the sixties of last century. The Iglulingmiut inhabit the region

[1] As to the language of the extinct Eskimos of Southampton Island see Mathiassen in this series, vol. IV, pt. 1, p. 281 sq.

[2] The Tununerusermiut are no tribe, but the Tununermiut families who, at a given moment, live in Admiralty Inlet.

round Iglulik at Fury and Hecla Strait, as well as the whole east coast of Melville Peninsula, as far as Lyon Inlet. Of the tribes belonging to this group they are the least influenced by civilization. The Aivilingmiut belong round Repulse Bay and on the west coast of Roe's Welcome, as far as Chesterfield Inlet. After the extinction of the Sadlermiut, the original inhabitants of Southampton Island, part of the tribe now frequently live in this great island.

As the ethnographer must mainly turn to the expedition of Parry and Lyon for information about these Eskimos, so our previous knowledge of their language is based upon Parry's list which, in fact, is by far the best vocabulary from all Central Eskimos west of Hudson Bay. Within more recent times Boas has published a series of texts from those parts.

Within this group the Iglulik dialect has been selected as a type. It contains the two characteristic voiced consonants z and ʒ which do not occur in Greenlandic. As was the case among the Oqomiut, the nasal final consonants are far more common than tenues, which however also occur; on the other hand q is not changed intervocally as in the Oqomiut words *ixadlung* [iʀätɪʟuŋ?], trout; *ixiqoq* [ɪʀɪqɔq?], little finger.[1])

As mentioned above, a retrogressive uvularization as well as labialization has taken place in Greenland, and so it will be interesting to see, how far this applies to the Iglulik dialect. A few examples will make this apparent.

| West Greenland. | Iglulik. |
|---|---|
| rʟ [kaŋᴇrʟuk], fjord. | rʟ [kaŋᴇrʟuŋ] |
| [ᴀ·rʟuk], killer-whale. | rdl [ᴀ·rdluk] |
| [mᴀrʟuk], two. | ʀ· [mᴀʀ·uŋ] |
| [pᴇrʟᴀ·q], sledge shoe. | r· [pᴇr·ᴀ·q] |
| rn [tɔ·rnᴀq], assistant spirit. | ʳŋʳ [tɔ·ʳŋʳᴀq] |
| [upĕr̃nᴀ·q], spring. | rnʳ [upᴇrnʳᴀ·q] |
| rq [mᴇrqut], needle. | rq [mᴇrqun] |
| [tᴀrqᴀq], cross-strop on kayak. | ʳpq [taʳpqᴀq] |
| (v)ʟ [iʟ·it], thou. | gv [igvin] |

It will thus be seen that like the Labrador group the Iglulik dialect has undergone uvularization, but not labialization. However, the Iglulik dialect is on a more primitive stage than that of Labrador. Thus, the rn-combinations still show distinct traces of the metathesis, and this also applies to the rq-complex. As compared with West Greenlandic the assimilation of rʟ to ʀ· and r· represent a more advanced stage which, at any rate

[1]) Boas: Dial. Cumberl. S., p. 101.

in the case of the former feature, recurs in Labrador, whereas the other peculiarities are more primitive.[1]) From certain spellings which Parry uses, it may be inferred that the metathesis within the Iglulik group is of a comparatively recent date; thus he writes *mādlĕröke, opēn-rā, il-weet* or *ɫg-weet.*[2])

Another old time characteristic, which is again met with in Labrador, is the retension of different sounds which have all been merged into s or ʃ in Greenland, for instance:

| West Greenland. | Iglulik. |
|---|---|
| [ise], eye. | [ije] |
| [aqis·eq], ptarmigan. | [aqigjeq] |
| [sakis·ät], breast, rib. | [sakidzän] |
| [as·äk], hand. | [aggän] |
| [pisis·eq], bow. | [pitikse]. |

The Aivilik dialect is extremely close to that of Iglulik, and very naturally, indeed, as mixed marriages are so common that the pedigree of practically all of these Eskimos, at most a couple of generations back, includes some individual of the other tribe. Some difference is, however, to be traced in the language. The nasal final consonants are a little less common with the Aivilingmiut and, as it seems, particularly in place names, which suggests that these sounds did not originally belong in this region. Besides, with the Aivilingmiut the Iglulik d is replaced by b or g, for instance:

| Iglulik. | Aivilik. |
|---|---|
| [udlɔq], day. | [ublɔq] |
| [udläktɔq], he runs. | [ugläktɔq] |
| [ma$^{d}$zäkpa·], he scrapes a skin thin. | [mabjäkpa·] |

Another word deserves to be mentioned: Iglulik [tisamän], four; Aivilik [sitamän]. The Aivilingmiut have a marked sing-song accent, and the last syllable is frequently long-drawn.

Generally speaking, from a phonetic point of view the Iglulik group must be said to be very close both to Greenlandic and the Labrador group, though considerably closer to the latter, but also on a still more primitive stage. —

The home of the Netsilik group is, roughly speaking, the regions round the Magnetic Pole, from Committee Bay to the east

[1]) This view aggrees with the view of Thalbitzer, but the possibility cannot a priori be dismissed that the assimilation to ʁ· and r· have taken place without a preceding metathesis. The latter case would be analogous with the assimilation of zg to ç (p. 28).

[2]) Parry, pp. 567 sqq.

towards Simpson Strait to the west. They constitute the smallest Central Eskimo group, numbering, according to the census taken by Knud Rasmussen, 423 individuals in all, and they are furthermore of all living Eskimo tribes those who are least influenced by civilization. While there are several sub-tribes or local groups, the following may be regarded as the main divisions: Arviligjuarmiut [arviligʒuˈarmiut]; Netsilingmiut [năciˈliŋmiut]; Ilivilermiut [iliviˈlɛrmiut]; Utkuhigjalingmiut [utkuhigʒaˈliŋmiut]; and Háningajormiut [haniŋaˈjɔrmiut]. The Sinimiut tribe which Rae met in Committee Bay is now extinct, with the exception of two men who live in the Repulse Bay District.

With regard to the language of all of these tribes no information has been available up to the present.[1])

The Arviligjuarmiut have their proper hunting fields on both sides of Simpson Peninsula in Committee and Pelly Bay, but from here several families have, during later years, immigrated to the regions round Repulse Bay. They have, however, not been absorbed into the Aivilik tribe, who regard the Arviligjuarmiut and the other more westerly tribes as a kind of uncivilized louts, although in their native place at any rate the latter are far abler and more well-to-do than the Aivilingmiut. The Arviligjuarmiut families therefore to a certain extent keep to themselves, although mixed dwelling places may occur, and they also retain their own habits and language even to the second and perhaps the third generation. Further, many Arviligjuarmiut come to Repulse Bay on trading expeditions, spend a year or two there and then return. It is this tribe whose dialect has been taken as a type. The Netsilingmiut are the tribe living on both sides of the Boothia Isthmus round the Magnetic Pole, whereas a subdivision of this tribe, the so-called Arvertôrmiut, live as far north as Bellot Strait and another, the Kûngmiut, round Murchison River. The Ilivîlermiut, better known under the less correct name of Ugjulingmiut, constitute the population at Simpson Strait. The Utkuhigjalingmiut, who formerly lived at the mouth of Back River, have now, through the influence of the Hudson's Bay Company's trading station at Baker Lake, become a perfect inland tribe, hunting caribou and trapping in the lower reaches of Back River south of Lake Franklin. The Háningajormiut and Ualiardlît, who from of old are inland tribes, now

[1]) The list of words which is given, together with a description of the Netsilik Eskimos, by John Ross (Appendix to the Narrative of a Second Voyage in Search of a North-West Passage, London 1835, pp. 61 sqq.) seems to be a compendium of Fabricius' Greenlandic Dictionary.

only consist of a few families round the great lakes at the middle course of the same river.

In this group we are, for the first time, confronted with the peculiar sound, the "glottal stop" which has hitherto not been recorded from the Eskimo language. It occurs in words like [i'nEq], fire, pyrites; [qi'mEq], dog; [u'läktɔq], he runs, in the Iglulik dialect [iŋnEq̃], [qiŋmiq̃], [udläktɔq] respectively. Here the Netsilik and the Iglulik groups seem to have taken different courses. Thus in the forms corresponding to *ignerk* (Mackenzie Delta), *knak* (South Alaska), *eknek* (Asiatic Eskimos)[1]), the Netsilik-group has weakened the consonant to a glottal stop, whereas the Igluliks have nasalized it.

The position of the Netsilik dialect as regards metathesis appears from the following examples, which should be compared with the words on p. 24.

| | ARVILIGJUAQ. | | WEST ESKIMOS.[2]) |
|---|---|---|---|
| West Greenl. | rL | [kaŋErtLuk], fjord. | *kangerdluk* (Mackenzie) |
| | | [A·rdluk], killer-whale. | *axlo* (N. Alaska). |
| | | [maLruk], two. | *mallœrok* (Mackenzie). |
| | | [poalrit], snow shovel. | — |
| — | rn | [to·ngAq], assistant spirit. | *toonrok* (N. Alaska). |
| | | [upiŋgA·q], spring. | *upinœrark* (Mackenzie) |
| | | [a·ŋruAq], amulet. | — |
| — | rq | [metqut], sewing needle. | *metkron* ( — ) |
| | | [tapqAq], cross-strop on kayak. | *tapkrein* ( — ) |
| | | [Erqetqɔq], little finger. | — |
| — | k· | [aŋatkɔq], conjurer. | *anutkoot* (N. Alaska) plur.? |
| | | [ʃatgomiAq], harpoon head. | — |
| — | (g)L | [adGEq], long-tailed duck. | *hâligerk* (Mackenzie) |
| — | (v)L | [itwin], thou. | *ilbit* ( — ) |
| | | [kublo], thumb. | *kublu* ( — ) |
| | | [ubləq], day. | *uvlut* ( — ) |

The two first and the two last-mentioned Netsilik words in this list resemble the Greenlandic having l as a last consonant, combined with r and b, respectively. This is explained by the sub-joined West Eskimo forms: they are the same words which at Mackenzie River and in Alaska have these combinations of sounds, and so

[1]) Rink: Esk. Tribes, Suppl. pp. 90 sq.
[2]) Ibidem, passim.

they cannot be classed with the words which have been subjected to metathesis. On the other hand, all the other words are destinguished from the Greenlandic, or, in other words, the retrogressive uvularization and retrogressive labialization have not taken place within the Netsilik group, any more than among the Western Eskimos. In this connection I should like to call attention to two other groups of consonants where also in some cases metathesis has possibly taken place, viz. old Greenlandic ks, now assimilated to ʃ· or s·, and Greenlandic ŋm, now assimilated to m·. The former complex occurs in the rare word [qaʃ·e], house of assembly or dancing house, which was spelled *kakse* by Fabricius. The Netsilik tribes as well as the Caribou Eskimos pronounce this word [qaɢ·e] with a long, faintly palatalized g; but sometimes the form approaches [qaᶻge]. Barnum writes *kazhga* as occurring in South Alaska. It is a likely supposition that the Alaskan form is the oldest. Unlike in Greenland, no metathesis has taken place with the Central tribes, but on the other hand there has been an assimilation of the two sounds to one palatalized sound. As to the ŋm-complex I have only the Cape York form [qaŋmăk], ankle, to support my hypothesis, the pronunciation on Simpson Peninsula as well as at Kazan River sounding like [qamŋʌq]. Both in West Greenland and in Alaska the words for ankle are derived from another root, and so cannot be taken into consideration. As with the rl- and bl-groups there are, however, cases where ŋm must be original and cannot be due to any metathesis; this, for instance, appears from [kiŋmiʌq], mouth-piece for bow-drill (Thule District); [kiŋmiʌq] (Simpson Pen.); *kinmiak* (Mackenzie R.); *kengméak* (North Alaska)[1]).

To the west of the Netsilik tribes, at Bathurst Inlet and Coronation Gulf, we find the fourth Central Eskimo group of dialects, viz. the so-called Copper Eskimos. The language has been thoroughly investigated by Jenness, a member of the Canadian Arctic Expedition, and therefore it will be more correct to postpone a discussion of its peculiarities, until the results of this author have been published. —

The Barren Grounds group is the most southerly of all Central Eskimos. It comprises the tribes of the Qaernermiut [qaᴱrnᴇrmiut], the Hauneqtôrmiut [haunᴇqtɔ·rmiut], the Harvaqtôrmiut [hʌrvʌqtɔ·rmiut], and the Pâdlimiut [pa·dlimiut][2]), who in all amounts to

[1]) Rink: Esk. Tr., pp. 73 sq.

[2]) The name is derived from [padlᴇq], willow, and should in West Greenland be called [paʟ'ᴇrmiut], but on the Barren Grounds it is always pronounced [pa·dlimiut]. Similarly, they here say [qamaˈni'cuʌq], the great river widening; in West Greenland, however, it is [qamaˈnᴇrʃuʌq].

about 500 individuals. The Qaernermiut is the tribe which was formerly known under the name of Kenipitu, a whalers' term, which was never used by the Eskimos themselves.[1]) They live round Chesterfield Inlet and Baker Lake. The Hauneqtôrmiut tribe, which only numbers a dozen families, hunt caribou within the coast between Rankin and Dawson Inlet, but come down to the sea in spring in order to catch seals on the ice. The Harvaqtôrmiut are entirely an inland tribe, their dwelling places being situated along the west-east stretch of lower Kazan River, the Eskimo Harvaqtôq[2]). South of the two latter tribes, right to the timber line, live the largest tribe of this group, the Pâdlimiut. In spring a small number of them come down to the coast at Eskimo Point and farther south, whereas the remainder stay inland all the year round.

Although the whole of this Eskimo group has been practically unknown from an ethnographical point of view, until the Fifth Thule Expedition, there is curiously enough no other Central group, from which so many lists of words are available. Besides those of Dobbs, Gilder, Tyrrell and Hanbury, we have the words communicated by Father Gasté in the dictionary of Petitot. However, they are all of comparatively little value, as the words are frequently written down in such a manner that unless one knew them beforehand, it would hardly be possible to understand them.

The oldest list is that of Dobbs, which goes right back to the middle of the 18th century. He does not mention from where he has his some hundred and fifty words and short sentences, but they are clearly from a tribe of the group dealt with here. Spellings like *petick-sic*, bow, *se-la-luk-toke*, it rains, *sha-veck*, iron[3]), suggest that they do not date from the Pâdlimiut, for they have now, at any rate, only h. This sound, however, Dobbs has heard in *ehick*, eye or rather eyes (dual.). In all probability a shifting of the tribes has taken place after the time of Dobbs[4]), which makes it impossible to say anything with certainty. Neither does Gilder tell us much about his list of words, beyond the fact that he got "much information" from a Qaernermio[5]). His list seems to

[1]) Low's name "Kenipitumiut" is neither here nor there. There is no place named Kenipitu, to which -miut can be joined.

[2]) Harvaqtôq [harvʌqtɔ'q], the one where rapids abound, is the correct name of Kazan River. The name *în'-nwi kog* [inuit-ko'ŋa] which is quoted by Tyrrell (p. 231) simply means the "river of men", viz. the river along which Eskimos live.

[3]) Dobbs, pp. 203 sqq.

[4]) This point will be further elucidated in my ethnographical report on "The Caribou Eskimos".

[5]) Gilder p. 33. The very short list which is given by Gilder's companion Klutschak (p. 229) is so inaccurate both lexically and phonetically that it is impossible to say for certain from which tribe at Hudson Bay it originates.

be rather unmixed, though not entirely Qaernermiut, for a word like *mok'-uk-too*, it rains, decidely appears to have come from Aivilik. Further, the words of Gasté are beyond a doubt from the Pâdlimiut, which also appears from the introduction written by Father Petitot.[1]) Owing to his nationality, the compiler of this list has failed to hear the h'es, for which reason he writes, for instance *naak* [nahʌq], fur hood, *anelρot* [hanälrut], whittling-knife, *ik-ik* [hikhik, hikxik], marmot. Tyrrell's list is the only one originating from the inland, his informant being a native of the regions round upper Kazan River. Hanbury mainly collected his material in Churchill from the old Hudson's Bay Company interpreter, Geo. Oman, a half-breed Indian, and thus the list is rather Pâdlimiut, but naturally without any phonetic value. A number of words, however, are indicated as originating from Baker Lake, or in other words from the Qaernermiut. The present list is also Pâdlimiut, compiled in a dwelling place at the outlet of Kazan River from Lake Hikoligjuaq, but the words associated with the sea have been supplemented from the coast group at Eskimo Point.

There is no reason to enter in detail into the phonetics of the Pâdlimiut dialect, as it shows rather close agreement with the Netsilik group. A glance here and there at the list of words will persuade us that retrogressive uvularization and labialization have not taken place. As mentioned above the s and ʃ of the Netsilik dialects are everywhere replaced by h, and when drawing conclusions from analogous cases in other languages, it seems natural to consider s to be the primary sound. Neither are the nasal final consonants heard. Glottal stops are still more marked than in the Netsilik dialect, so that the Pâdlimiut almost jerk and hack out their sentences, alternately with a high and a low accentuation of the syllables. Their vowels seem a little purer than the Greenland ones, a is more open, o more closed and the nasalization is inconsiderable. The Harvaqtôrmiut dialect is almost like that of the Pâdlimiut, whereas the Qaernermiut and Hauneqtôrmiut dialects are little more removed from it, having ʃ instead of h and making a less frequent use of the glottal stop.

[1]) "Ils (i. e. the words) m'ont été fourni par mon confrère, le R. P. Gasté, missionaire au lac Caribou, qui les a reçu de la bouche des *Agutit* ou Esquimaux de Churchill, sur la côte occidentale de la Baie d'Hudson" (Petitot, p ii). The word Agutit is never used as the name of a tribe but is presumably [aqutit], men.

## Conclusion.

From the preceding there can be no doubt that, within the dialects dealt with, the most primitive phonetical stage represented is that west of Hudson Bay. Neither in the region round the Magnetic Pole, nor on the Barren Grounds have retrogressive uvularization and labialization taken place. In the development of language the Iglulik tribes have followed the same courses as those of Labrador. The retrogressive uvularization seems to be oldest in the ʀʟ-complex, in so far it is quite correct that it is not only fully completed at Iglulik, but that, as in Labrador, a further development has taken place, by which the ʟ has become assimilated by the r.[1]) On the other hand, the rn- and rq-combinations show their more recent origin by the fact that the metathesis has in neither case been entirely completed at Iglulik, and the same applies to the rn-complex of the Thule District, in which perhaps the metathesis is thus most recent.

Retrogressive labialization has not taken place outside Greenland. However, there seem to be certain facts relating to the complex which has been influenced by the Greenland labialization (ᴠʟ) which, nevertheless, refer the Central Eskimo[2]) dialects now spoken to a somewhat more recent stage than the West Eskimo ones. This also applies to the assimilation of zg to ʒ. But in both cases the material is too limited to permit of any definite conclusions being drawn.

Of other, presumably primitive features in the Netsilik and Pâdlimiut group may be mentioned the occurrence of r and ʁ in certain combinations, where West Greenland has s or ʃ, and the Labrador and the Iglulik group ʃ or j. With the Netsiliks [ugʒuk], barbed seal, and [qugʒuk], swan, frequently sound almost like [ugruk] and [qugruk]. The Pâdlimiut always have [ᴀqʁᴀq], aurora borealis, and [ɔqʁɔq], blubber. This quite agrees with Alaskan forms. Thus the dialects spoken in Alaska cannot lay claim to being treated as something apart to the same degree as formerly, although on certain points they still represent the most primitive stage. Neither should it be forgotten that in other respects than the metathesis mentioned above, they are the most advanced, viz. by dropping i in unstressed syllables and the intervocalic n and ŋ. Much still remains to be done, before linguists will be able to give an undisputable answer to the question as to where the Eskimo language was first spoken.

[1]) The possibility that no metathesis whatsoever has taken place before the assimilation, has been suggested in the footnote nr. 1 on p. 25.

[2]) As mentioned above, the Copper Eskimos must be left out of consideration.

Only one more thing should be mentioned. Perhaps one of the most important results of the Fifth Thule Expedition is that it was able to demonstrate that in former times a culture prevailed within the central regions, which was extremely close to the Alaska and Greenland culture, but that this homogeneous culture was split up into two parts by the subsequent penetration of inland tribes[1]). The question then presents itself whether this fact has left any trace on the language. At any rate I believe myself to be entitled to mention one such phonetic trace, viz. the distribution of the peculiar voiceless lateral ʟ. It seldom occurs in the Central dialects, which mainly have a common voiced l, but it plays a great part in the far east of Greenland, as well as in the far west of Alaska, indeed, even in the extreme link of the chain of Eskimo tribes, the Ugalagmiut. As stated by Buschmann[2]), it is a sound with a marked western distribution in North America, as it also occurs among the Tlingit, the Athapascans, the Nootka and the Nahua, and it does not seem improbable that this sound has been adopted into the Eskimo language in Alaska, whose culture has generally been subject to very strong influences from the North Pacific coast.

[1]) Mathiassen, pp. 212 sqq. — Birket-Smith: Prelim. Report, pp. 203 sqq.

[2]) Buschmann, p. 672. — After this was written I have learned that my friend Dr. D. Jenness, of the National Museum of Canada, is working at a treatise, in which more particularly the West Eskimo sounds will be dealt with, and so I shall not go into details regarding this subject.

# IV. Vocabulary.

## Universe and Division of Time.

| English | West Greenland | Thule District | Melville Penª | Simpson Penª | Upper Kazan R. |
|---|---|---|---|---|---|
| 1. Aurora borealis | ar sārneq | { ar'sarneq<br>arsaq | aq'∫arneq̄ | aqxaq | aqraq |
| 2. Autumn | ukiaq | ukiaq | ukiaq̄ | ukiaq | ukiaq |

# V. Notes.

## Universe and Division of Time.

1. This term refers to the belief that the aurora borealis is due to the playing of ball of the dead; [ʌrʃʌq], ball; [ʌrˈʃʌr̃nɛq], the playing of ball[1]).
3. cf. No. 11.
4. [tine], ebb; [ule], flood.
5. cf. No. 27; [kaŋɛq] is higher than [nu·k]. In West Greenland [tik·ɛrʌq] is only known as a place name, for instance Dark Head in the Upernivik District; but both in Labrador and Alaska it is a noun[2]); [tikip·ɔq] has come.
8. Besides o-*gloo'-me* Gilder gives *wateh-eur*, "a little while ago, to-day". Corresponding with this Poul Egede writes from West Greenland *vutsiak*, Anderson *voitsach*[3]); [uʷät$^{s}$iʌq] now means "this morning", [uʷät$^{s}$iʌro], at a later hour to-day.
9. Although the Polar Eskimos know [unuk], they maintain that the word is only used in verbal forms, as [unukpät] or [unuɪɛrpät], when it is (on the point of becoming) evening. Hanbury also has the form *u-nūk-pŭt*[4]).
11. cf. No. 3. In the Thule District [kaŋɛrdlukʃuʌq] is used as a place name.
12. From West Greenland Davis gives *tucktodo*, "a fogge"[5]), but this word does not occur in any later Greenland dialect. In Labrador *táktok* means fog, *pujok*, smoke, and the same seems to be the case in Alaska and among the Siberian Eskimos[6]).

[1]) Here, as everywhere in this chapter, the forms given are West Greenlandic, unless remarks are made to the contrary.

[2]) Rink: Esk. Tribes, Suppl. p. 86. — Wells & Kelly, p. 64. — Richet, p. 319.

[3]) Gilder, p. 308. — P. Egede p. 207. — Anderson p. 301.

[4]) Hanbury p. 300.

[5]) Davis, p. 21.

[6]) Erdmann, pp. 310, 257. — Rink: Esk. Tribes, Suppl. pp. 89 sqq. — Ray, p. 56. — Richet (pp. 314, 318) writes *poo'aiuk*, steam, and *taptook'tuk*, fog.

From Baker Lake Hanbury gives *tūk-tū*, from the Coast Pâdlimiut *tekki-kūni*[1]).

14. Father Gasté's *ukkiak*[2]) is presumably a misprint for *ikkuak*, West Greenland [sikuaq].

20. In West Greenland [qamenėq] is a narrowing of the current in a river, on the Barren Grounds as in Labrador[3]), a widening of the river.

22. From the 17th century *aningang* is mentioned from West Greenland, and is later on mentioned from there as "nomina propria Lunæ", as opposed to [qa'mät][4]). At Angmagssalik and on Frederik VI Coast *aningat* is used, but the Polar Eskimos also know *kaimut*[5]). At Cumberland Sound both words are used, although it seems as if [qaumät] makes part of the conjurers' language, and also *takirn* is known; finally, Parry from Melville Peninsula gives *an-nīnga*, the moon, and *tāt-kuk*, its name[6]). Here an exchange of the words seems to have taken place. Central Eskimo [tatqiq] perhaps in connection with [tarqip'a'], trims the wick, makes (the lamp) burn more strongly.

24. [qaupăn], when it becomes light, is used in the Labrador, Cumberland Sound and Mackenzie dialects in the sense "to-morrow", [aqagu] in the two former places meaning „next year[7]). From West Greenland in the 18th century Anderson gives *kaupèt* as „another day", rather however "to-morrow"[8]).

25. Cf. No. 24. [uŋalɛq], the one closest beyond something else; [uŋata'], "its on-the-other-side", viz. that on the other side of it. Hanbury however, gives *ūk-argo-argo*[9]).

25. [qat$^{s}$ip'ɔq], is comparatively highly situated; [kiŋit'ɔq], the steep. With the Arviligjuarmiut and the Pâdlimiut [qatqaq] seems to denote the very peak.

27. Cf. No. 5.

29. [manɛraq], a large, even plain, especially on the ice, but also on land; in Labrador, on the other hand, *mannerak* is a plain, *nâksak* a valley[10]).

[1]) Hanbury, pp. 297, 304.
[2]) Petitot, p. 35.
[3]) Erdmann, p. 105.
[4]) Bartholin, p. 71. — Olearius, p. 86. — P. Egede, p. 15. — Kleinschmidt, p. 30.
[5]) Rink: E. Greenl. Dial., p. 214. — Vibæk, p. 33, — Ross, p. 121.
[6]) Boas: Cent. Esk., pp. 659, 661. — Ejusdem: Dial. Cumberl. S., p. 105. — Parry, p. 564.
[7]) Rink: Esk. Tribes, Suppl. p. 78. — Boas: Dial. Cumberl. S., pp. 98, 105.
[8]) Anderson, p. 301.
[9]) Hanbury, p. 300.
[10]) Kleinschmidt, p. 201. — Erdmann, pp. 165, 179.

30. [atanEq], place-name in West Greenland from [atavɔq], is connected with. Tyrrell translates portage by *nap'-muck*, perhaps from [nam'äp'ɔq], carry something on one's back, Hanbury by *ikī-wīt-tūt*[1]).
32. Cf. verbs No. 48. [qis·ERLup'ɔq], is drizzly weather. The Iglulik [maRuk] may correspond with *mok'luk* [maqluk?], moist, in North Alaska, and possibly *mō'rhum*, water, in South Alaska[2]). In West Greenland [maRaL'uk], swamp. The Arviligjuarmiut word [hilaluk] identical with *si'-la-lu* at Point Barrow[3]); from [sila], weather; [nipaluk] corresponds with the stem of [nip'aL'-ivɔq], the weather has abated.
34. [tarajɔq], salt or salt water.
36. [sila], weather, air, but also an impersonal magic power[4]).
37. [nit·a·laq] is thick weather; cf. verbs No. 71.
39. The Pâdlimiut word [pEqxikune] presumably a verb.
43. [suL·ɔq], a tubular cavity, for instance the hollow part of a feather shaft. Anderson's *túnnua*[5]) means "its back (in casu east) side".
45. Petitot's *illa-uyak*[6]) [hilaujaq], that which resembles the weather?
46. [imaq], fresh water; [misarpɔq], makes a splashing sound. In Labrador *missalerak* is "vom Wasser durchzogene Schnee, wenn das Wasser nur noch wenig ist."[7]) [näᵗsin·aq], an even plain.
47. [itˢaq] denotes longer time than [qaŋätˢiaq]; [imane], rather long time ago. Parry's *al-ṫā-nee*[8]) means "last year".
49. [imaq], sea; cf. No. 34.
53. [-mivɔq] expresses something defective; [ukiomikpät] should, according to Greenlandic parlance, mean "within not a whole winter". Perhaps there is a mistake. [arlaq], one of several, with the localis ending [-ne].

## Animals.

4. In West Greenland both [qupaluarsuk] and [qupanavarsuk] occur, the latter form in the southern dialects[9]). To this wavering

[1]) Tyrrell, p. 230. — Hanbury, p. 297.
[2]) Wells & Kelly, p. 56. — Richet, p. 302. — Barnum, p. 353.
[3]) Ray, p. 56.
[4]) Birket-Smith: Ethnogr. Egedesm. Distr., pp. 433 sq.
[5]) Anderson, p. 286.
[6]) Petitot, p. 66.
[7]) Erdmann, p. 172.
[8]) Parry, p. 564.
[9]) Kleinschmidt, p. 158. — Schultz-Lorentzen, p. 128.

between l and n corresponds in West Greenlandic [qilälugaq], white whale, Iglulik [qinalugaq], and West Greenlandic [kanajɔq], sea-scorpion, at Point Barrow *kŭ'n-ai-o* or *kŭ'l-ai-o*[1]). Simpson Peninsula [tiŋmiarzuk qaqɔrtaq], the special, white bird; [ama·ligaq], "provincially" in West Greenland snow-bunting[2]); according to Jacob Olsen especially used about fledgelings.

5. At Thule [qupa'norohEq] is a common name for all small birds, excepting the snow bunting; [tiŋivɔq], he flies.
6. Kleinschmidt translates [tarqalerqisa·q] by "a ray": Schultz-Lorentzen on the other hand by "night-butterfly" (N. Greenland)[3]), and finally Jacob Olsen translates it by "a kind of small freshwater animal". The sense of butterfly also occurs in Labrador, at Mackenzie River and in Alaska[4]).
8. [sulup·'a·vaq], Norway haddock (Sebastes marinus). On the Barren Grounds [huluk'pau$^{w}$aq] denotes the Arctic grayling (Thymallus signifer), hardly the perch, as written by Tyrrell[5]). From Point Barrow Murdoch translates *sulukpau'ga* by Thymallus signifer[6]).
10. In East Greenland *pangneq* means the musk-ox[7]).
11. [nɔr·alik] means the caribou cow with her calf [nɔr·aq]; otherwise [nɔr·ait$^{s}$ɔq].
13. [tăl·o], chin.
15. [as·agiaq], a kind of crab; [kiŋuk], sand-hopper, shrimp.
16. [käl·o], bone mounting on the kayak paddle.
22. The Pâdlimiut [a'a·neq] is an imitation of the voice of the bird.
23. [ap·a], Brünnich murre; [nujalik], "provincially" merganser[8]).
24. [mitEq], eiderduck generally; [mitivik] especially Somateria molissima. Parry gives *am-mōw-līgūōk*[9]); [ama·lik], male eiderduck.
25. Cf. No. 24.
29. Cf. No. 28.
30. [anaq], fæces; [anariaq], dungfly.
32. Also [qaquL·uk] is known at Disko Bay.
33. [-vik], true, genuine.

[1]) Ray, p. 54.
[2]) Kleinschmidt, p. 24.
[3]) Kleinschmidt, p. 352. — Schultz-Lorentzen, p. 128.
[4]) Rink: Esk. Tribes, Suppl. pp. 81 sqq. — Richet, p. 317. — Petitot, p. 51. — Ray p. 55.
[5]) Tyrrell, p. 229.
[6]) Murdoch, p. 58.
[7]) Rink: E. Greenl. Dial., p. 218.
[8]) Kleinschmidt, p. 257.
[9]) Parry, p. 561.

36. The white-fronted goose occurs on the coast of Hudson Bay, but is rare.
37. In Labrador also *pitsiulak*[1]) is used; perhaps from [pis·ip·ɔq], leaps.
40. In West Greenland [qi'ɔqe] is used as a place-name in the Ũmánaq, Godthaab and Frederikshaab Districts; but the meaning is uncertain. Kleinschmidt translates the word by "something that has been cut off and pushed aside"[2]); [qiɔrpa·] trims it. The Igluliks know the word, but are not quite sure of its meaning. In the other dialects it seems, however, sure enough.
43. Cf. No. 42.
48. [niviuvăk], blow-fly. In Labrador *kiktoriak* is a mosquito, and so also at the Mackenzie River and in Alaska[3]). Tyrrell writes from Kazan River *kik-tō'-ri-ak,* "maragouin"[4]).
51. Cf. No. 4.
54. [nis·a'p'ɔq], belches; [nis·a·lʌ·rpɔq], cackles.
55. The Pâdlimiut use [aqigʒᴇq] of the bird in its winter garb, [aqigʒivik] of it in its summer garb, when with its russet neck it is sharply distinguished from the rock ptarmigan; [-vik], true, genuine.
56. [qɔ·rup·ɔq], suffers from cough.
59. From Cumberland Sound Boas gives *apā* as a bladdernose with a white belly and a black back, as being distinguished from the ordinary *qai'rolik*[5]). Perhaps it has been mistaken for the saddleback, cf. No. 60. From Labrador *abba* is only given as "eine Art Seehunde im Norden", from Mackenzie as "phoque à nez pointu"[6]).
60. Cf. No. 59. From Labrador we have *kairolek*, saddleback, and from Point Barrow *kaixo'lĩñ*, ribbon seal (Phoca fasciata)[7]).
61. Cf. No. 60.
62. [puise], seal generally, originally when rising above the sea, as opposed to [o·t·ɔq], when it lies on the ice. At Thule [nät$^{s}$ᴇq] is only used of the seal-skin jacket.
63. [tuʌrmiɔq] gravel dweller? [tuapăk], boulder.
65. The Arviligjuarmiut [ugʒuk] approaches [ugruk].

[1]) Erdmann, p. 252.
[2]) Kleinschmidt, p. 148.
[3]) Rink: Esk. Tribes, Suppl. pp, 81 sq. — Ray, p. 55.
[4]) Tyrrell, p. 229.
[5]) Boas: Dial. Cumberl. S., pp. 99, 104.
[6]) Erdmann, p. 1. — Petitot, p. 54.
[7]) Erdmann, p. 98. — Murdoch, p. 56. — Ray, p. 54.

66. Cf. No. 65 [alEq], harpoon line; [-s·aq], that which is going to be.
68. [nanɔq], polar bear; [-usaq], that which resembles.
70. Cf. No. 15 [as·äk], hand; [ip·iarsu·saq] heroe; [qiɔrfik], cutting board. Parrys *ādd͡ee-yūgg͡ee-yū-ĕ-yĕt*[1]) is perhaps "those that resemble fingers".
71. [qugʒuk] with the Arviligjuarmiut something like [qugruk].
80. Cf. No. 51.

## Plants.

1. At Thule [nuniva·t] is a common appellation for leaves on bushes, for instance, also on willows; [nuniäp·ɔq], gathers berries; [nukEruaq] roots running out from a bush. From Baker Lake Hanbury gives *au-a-lĕk-ĕ-ăk*[2]).
2. [qisuk] wood (for fuel); [-s·ät] something for; that which is going to be.
3. Cf. No. 4.
6. [ipEraq], lamp-wick, which was originally made of moss.
7. Corresponding with the Iglulik word [nɛ̃r̃ŋnät] occurs in Labrador *nexa'γasuk* and at Mackenzie *néɸɸèyoaɸk*[3]), perhaps from [nEqe], meat, food; [tiŋe], hairs on the groin.
9. [paL·Eq] means in West Greenland particularly, but not exclusively, the dead, dry branches which are suitable for fuel[4]). A similar distinction is made in Labrador and on the Barren Grounds[5]).

## Man and the Human Body.

1. [qam·ip·a], fills something with a heaped measure; [qatik], breast-bone of a bird; [qati·ŋavɔq], is convex. Cf. also "Boats and Sledge" No. 6.
12. [pe], thing; [nutaq], new; [nutaraq], puppy.
26. Gilder's *puk'-beeg*[6]) is presumably [paf·ik], wrist.

## Dwellings and Furniture.

1. The word strictly means "nostril". The air-hole is lacking on the Barren Grounds where the snow houses cannot be heated.

[1]) Parry, p. 567.
[2]) Hanbury, p. 305.
[3]) Hawkes, p. 34. — Petitot, p. 42.
[4]) Kleinschmidt, p. 276.
[5]) Erdmann, p. 232. — Tyrrell, p. 230.
[6]) Gilder, p. 311.

2. [iʟ·o], house; [inuk], human being. Anderson translates dwellingplace by *innà*[1]), suffix form of [ine], place; [ina·], its place, dwelling, nest (for birds), trail left; [inᴇrsuit] "great trail" is a frequently employed exhortation to sledge-dogs.
5. In West Greenland the fire-drill has disappeared long ago. [inᴇq], fire; [ikip·a·], lights it; [ɲio], leg; [ni·ɔrpɔq], drills.
10. [pu·gutaq], plate, bowl. The Arviligjuarmiut [higzᴀ·q] is perhaps from the same root as the Mackenzie word *tchitkƥayoaƥtoaƥk*, is filled up[2]).
11. Perhaps [än·iga·], hides it. Otherwise with the Central Eskimos there is, as a rule, no open space below the platform, the latter being constructed of snow.
13. [ake], window platform, strictly "opposite". In the snow house [ikpät] denotes the part of the platform nearest the main platform, where the lamp stands, whereas [ake] is the part nearest the front wall.
16. [iga] European pot, or a pot which is not meant to be suspended; [qulis·iut] pot for suspension above the lamp. Kleinschmidt and Schultz-Lorentzen only recognize [uk·usik] as a placename, though the latter gives the sense of pot from Labrador. At Angmagssalik, however, *ikiseq* is used[3]).
17. Nowadays no special snow-beater is used in West Greenland, but this was possibly the case at an earlier period[4]). Still, both [tilut·u·t] or [silut·u·t] and [ana·lᴇrut] are used of a stick to beat clothes with.
18. The snow-knife is not employed in West Greenland, where snow houses are not built nowadays, though it occurs in many finds from of old; [savik], iron, knife; [pana], sword.
19. The snow-probe is unknown in West Greenland; [aput], snow lying on the ground; [savip·a·], feels it; [sät·iut], feeler.
20. A special snow-shovel is not used in West Greenland; [nivaᴛaq], shovel generally; [qalɔ·rpɔq], bales or scoops several times; the stem [po] expresses a lifting.
22. At Frederikshaab [qaluta·t], spoon; Olearius' *keijuta* is undoubtedly [qaju·taq], soup ladle, like Parry's *ilia-oot* is the Iglulik word [ilaut] ice-scoop[5]).
23. [itˢät], strictly the inner cover of the tent, but now frequently

[1]) Anderson, p. 289.
[2]) Petitot, p. 61.
[3]) Kleinschmidt, p. 405. — Schultz-Lorentzen, p. 325. — Rink: E. Greenl. Dial., p. 221.
[4]) Cf. Birket-Smith: Ethnogr. Egedesm. Distr., p. 208.
[5]) Olearius, p. 86. — Parry, p. 567.

used in West Greenland about the whole of the skin tent, [tupeq] then being used about a tent of European material.

28. [qaL·ut] dipper: from North Alaska the word *kuloot* is given[1]).

## Dress.

2. Gasté writes *ippépautik*[2]), which are the very long-topped boots used in the spring; [ipera·rpɔq], wades through a svamp. Hanbury translates *ipper-au-chick* by "sealskin boots" and *kummuk* by "moccasins"[3]).
4. In West Greenland the combination suit was only used for whaling by grown-up people, but, as among the Central tribes, it was common for children.
5. At Thule [ati·t] is also used of the under-jacket made of hare-skin; [ativa·], puts on a garment; [mitEq], eiderduck.
7. [atigEq], over-jacket made of deerskin[4]), or a similar sense as [qulitsAq]. Hanbury translates *ulu-pāk*, "deerskin coat (inner)"[5]), a misunderstanding for [ilupa·q], European shirt.
8. [kapitäk], waterproof kayak jacket; [kapitAq], an inner garment which is put into an outer one of the same shape; hence, at Angmagssalik [kapita·], stocking[6]); [mErqɔq], a hair. From Cumberland Sound we have *kapitaq*, waterproof fur jacket, *miqusang* deerskin jacket[7]).
11. At Thule [A·rqät] is a mitten made of sealskin, [po·aluk], a mitten made of deer- or bearskin. On the east coast of Greenland *pualâtit* is used[8]).
12. Cf. No. 4. Hose, viz., trousers and boots made out of one piece, were used in West Greenland, when there was a prospect of wading in water, as well as by children. They are hardly used any more by grown-up people.
13. [isigam·Aq] and [alɔqut], sandal; [nam·a·tAq], carrying strap, the sandal being tied across the foot by means of a thong. Neither Kleinschmidt nor Schultz-Lorentzen have the word [ala·mäk]; [alAq], sole. On the other hand Schultz-Lorentzen gives [ikĕr̆nuk], sandal (obsolete)[9]).

[8]) Rink: E. Greenl. Dial., p. 221. — Vibæk, p. 19.
[9]) Schultz-Lorentzen, p. 63.

15. Cf. Nos. 13 and 1. [tut·o], caribou; [tuktuqut], deerskin shoe both at Iglulik and on the Barren Grounds; [isigagun] and [itigam·ajäk], sealskin shoe. At Thule overshoes are only used by women, whereas the men have boots [kamikpäk] or, if they are made of hairy sealskin, [niɔriäglik]. In West Greenland overshoes are now no longer used; Anderson has *isiamach*, shoe[1]).
19. At Iglulik [silapazän], outer trousers; [ilupazän] inner trousers; on the Barren Grounds [qarli·k] only means the wide trousers; the narrower ones which are used in severe cold are called [qalerugʒuk]. [nanɔq], bear; [sila], weather; [ilo], inner.
20. [nän·uk] at Thule used about women's trousers, although they are always made of blue-fox skins.

## Hunting.

5. The Arviligjuarmiut [nauliŋniut] is used for trout, never for seal. [na·ligaq], harpoon for boys.
10. [a·q], sideprong of bird dart.
11. [eqaluk], trout; [narajaq] or, as Egede has, *narriak* bait[2]).
12. Cf. No. 15. [sa·rqut], hunting implement lying on the kayak in front of the hunter. In East Greenland [ca·rqin], knob harpoon[3]).
13. [una·q], knob harpoon; [ĕr̆nan·ät], winged harpoon; [qa·teq], bone mounting, "socket piece", on front part of the harpoon shaft. At Iglulik [qa·tiliŋ] is a seal harpoon, [una·q] a walrus harpoon.
14. [sak·o] is still known and originally meant the small harpoon head for ice hunting[4]). In the Thule District [sak·o] is the thin harpoon head used for seal and walrus, [tu·k·aq] the broad head for white whale and narwhal. At Angmagssalik [sak·e] means harpoon head and foreshaft together[5]). At Iglulik the word *siatko* is known[6]). The existence of the word [tu·k·aq] within the Netsilik group appears from the word for harpoon line.
16. Cf. No. 14. [iparaq], short harpoon line for ice-hunting, or perhaps sometimes a cross-piece of wood, placed at the back of this line.

[1]) Anderson, p. 289.
[2]) P. Egede. p. 116.
[3]) Thalbitzer: Ethnogr. Coll. E. Greenl., p. 410. — Vibæk, p. 23.
[4]) P. Egede, p. 164.
[5]) Thalbitzer: Ethnogr. Coll. E. Greenl., p. 433.
[6]) Boas: Dial. Cumberl. S., p. 111. — Ejusdem: Centr. Esk., p. 661.

18. [savik], iron, especially knife; [pilăp·a·], flenses seal, or the like.
19. The word is used in the Thule District about the broad hindmost part of the ice-hunting harpoon, which for lack of a special implement is employed as an ice scoop.
20. [ipo], shaft, handle. Hanbury's *ipu,* spear[1]), is thus due to a misunderstanding.
27. [ʁqaluk], trout. At Mackenzie River *itkɋaluktçiun* means a fish-hook[2]).

## Boats and Sledge.

2. [ipiutʌq], narrow isthmus, the optic nerve. The meaning of trace is also known from Labrador and Cumberland Sound[3]). [qitɔ̃r̃nʌrtɔrqut], the short strap farthest back in the harness, to which the trace is attached. The Central Eskimos, however, make no distinction between this strap and the trace. Gilder's *ok-zu-nar'* = [aglunʌ·q], seal thong generally.
3. The kayak was re-introduced into the Thule District in the sixties of last century by immigrators from Admiralty Inlet, after having been out of use for a long time. The technical terms relating to the kayak must therefore also be supposed to have been introduced from Baffin Land.
6. [năpasɔq], something upright, viz. the rib of an umiak, as in the Thule kayak divided into a horizontal and a vertical part. [năpasɔrtʌq], the bone point on the harpoon shaft, to which the throwing board is buttoned. Cf. "Man and the Human Body", No. 1.
7. Cf. No. 15.
8. [sine], edge.
9. [sane], side.
13. The words are dualis — in West Greenland pluralis — of [qamut], runner. Regarding Hanbury's *nūp-pūt,* "sleigh-runners"[4]) cf. No. 15.
19. [umiʌq] is used at Hudson Bay about European boats.
20. [silup·ɔq], lifts the arm in order to strike or to throw.

[1]) Hanbury, p. 298.
[2]) Petitot, p. 37.
[3]) Erdmann, p. 87. — Boas: Dial. Cumberl. S., p. 101.
[4]) Hanbury, p. 306.

## Tools.

1. In the Thule District the adze is only known through tradition; the European axe is here called [iko·tʌq], cf. No. 3. In Cumberland Sound *qaï'vun*, drill[1]). [agiʌrpɔq], files. On the southern Barren Grounds no adzes are known at present, but an object which presumably is an adze handle was found in a rather recent grave on Sentry Island, and Dobbs has *willimout*, hatchet[2]). From the Coast Pâdlimiut Hanbury has *i-pu*, cf. the section on hunting, No. 20.
2. Cf. "Hunting" No. 18. A special whittling knife is not used by the Polar Eskimos. From West Greenland Poul Egede has *sennárlut*[3]); [sanavɔq], makes, manufactures. At Point Barrow as in West Greenland [savik] is used of all knives[4]).
3. [iko·tʌq], an object which is placed below something else, in casu below the mouth piece. In his list Parry gives *ik-koo-tak*, and the word also occurs in Labrador[5]).
4. [ka·vip·ɔq], turns round, goes in and out. Poul Egede gives *kevlerrut* drill[6]). [pisis·Eq], bow; [pisis·ERʌq], small bow.
7. [käk·ivik], needle cushion. The Pâdlimiut do not keep the needle in a needle-case, but put them into a tuft of moss.
8. In West Greenland special scrapers seem to be on the point of disappearing, being replaced by the woman's knife or a natural blue-mussel shell [uilɔq]. A kind of grease scraper without a handle, which is used in certain places in the Egedesminde District is, therefore, called [uilo·sʌq]; [Ersɔrsit] denotes a stone, very little shaped, with which the skins are scraped[7]). In the Thule District only one kind of scraper is used for the preparation of skins. The tribes of the Iglulik and Netsilik groups have, as a rule, for the removal of grease and softening a scraper consisting of a caribou shoulder blade, and for scraping the skins thin a sharp iron scraper. When they have no iron, a sharpened bone scraper is used. The Caribou Eskimos and sometimes the Netsilik tribes have, besides the bone and iron scraper, always a sandstone scraper for softening the skins. [sERLÉRnʌrpɔq], is handy, particularly at removing some-

[1]) Boas: Dial. Cumberl. S., p, 104.
[2]) Dobbs, p. 204.
[3]) P. Egede, p. 166.
[4]) Murdoch, p. 157.
[5]) Parry, p. 561. — Rink: Esk. Tr., Suppl. p. 73.
[6]) P. Egede, p. 80.
[7]) Kleinschmidt, p. 72. — Schultz-Lorentzen, p. 57.

thing secretly; [sɛrlɛ̃rnartɔq], a sleight-of-hand performer[1]). This sense is, however, probably more recent: for Fabricius only translates it by "is handy, can do all he sees"[2]). [sak·o], implement generally; in East Greenland woman's knife[3]). From Hudson Bay Parry and Gilder give *šeāk-koot* and *suk'-koo*, respectively[4]). [isit·ɛrpa·], extends it.

13. In the Egedesminde District, West Greenland, [mɛrsuin·aŋaq], "ordinary sewing". [katinɛq], joining; [kiluk], seam; [sik·ik], a straight side. With the Iglulingmiut [kilugluktɔq] particularly means sewing over-and-over with long stitches.
14. [anuva·], pulls it out of a hole, or the like.
15. According to Kleinschmidt [pus·arinɛq] is not the ordinary blind stitch, but the insertion of a folded strip into the seam; [kakiɔrnɛq], the ordinary blind stitch. In the Egedesminde District the word [tuin·aŋaq] was given. With the Iglulik and the Caribou Eskimos, respectively, [umaˑqtɔq] and [umagaq] means the outer seam in a boot or the like, [atuŋ·ɛqtɔq] and [ilul·igaq] the inner seam, as two seams are used in order to ensure its being waterproof. The former is a blind stitch. In Labrador and at Cumberland Sound *umak*, seam at the sole of the boot[5]). [qiŋaˑq], the edge of the skin; the seam of the boot along the latter is, on sealskin boots, sewed with blind stitches.
16. Cf. "Man and the Human Body", No. 20.

## Sociology and Religion.

2. Cf. "Universe and Division of Time", No. 1.
5. [ɛrinăk], tune; [ilise·p·ɔq], conjures to the detriment of another.
7. [mumɛrpɔq], sings without words. According to Kleinschmidt a rare word[6]). Song is inseparable from Eskimo dancing.

## Relationship

1. [ila], the one belonging; [iläk·a], those belonging to me, viz. my family, my comrades and the like.
2. [aŋajɔrqaˑq], parent.

[1]) Kleinschmidt, p. 318. — Schultz-Lorentzen, 252.
[2]) Fabricius, p. 415.
[3]) Thalbitzer: Ethnogr. Coll. E. Greenl., p. 504. — Vibæk, p. 21.

[5]) Erdmann, p. 349. — Boas: Dial. Cumberl. S., p. 114.
[6]) Kleinschmidt, p. 214.

3 [it$^{s}$ɔq], the oldest man in the house.
4. [niŋio], the oldest woman in the house.
11—12. Temporary "husband and wife", by exchange of wives. [aviliʌq], co-wife (of a woman); [aŋut], man; [ʌřnʌq], woman; [a·p·a], the other.
15. [nukari·t], brothers or sisters.
30. Kleinschmidt has [qaniʌq][1]).
31. With Kleinschmidt [aŋ·äk].
32. With Kleinschmidt [ujɔruk].
33. With Kleinschmidt [nuʌraluʌq].
46—47. Kleinschmidt has [nukʌ̃·řŋɔq].
48—49. Kleinschmidt has [aŋajõ·řnɔq].
50—53. With Kleinschmidt [nulɛq].
54—55. [najugʌq], the person one stays with.
57. [tiguva·], takes it, him.

## Numerals.

6. [igluane], on its other, viz. hand.
11. [isik·ane], on the toes; [sinɛrpɔq], follows the edge.
16. [sine], edge; [sinaqalɛrpun], they begin to have an edge.
20. With the Polar Eskimos [kasɔrglutut] means not quite up, viz. finished, and corresponds with [kautut] 21. After that they count [audlʌrqisut mʌrdlunik] 22 etc. [qulit ilaqalɛrpun], 10 begins to have something with it.

## Particles.

2. [aso], well then, at last.
4. Parry writes *nāk-ka* and *nā-ŏ*[2]). [nauk], even if, where (interrogative). At Hudson Bay frequently used in the sense almost of "No".
5. At Angmagssalik *êqe,* no; at Cumberland Sound *a'qai*[3]); cf. No. 1. Petitot has *ilnukuni* and *itçumaminik*[4]).
6. At Thule [sainäkʃunai] is also a welcome. As at Cumberland Sound[5]) [qujanʌq] also at Aivilik means "well, if it cannot be otherwise". Gilder writes *kuyan'-a-mik*, pleased, and *quee-en'-nak-coo'-nee*, thanks[6]). The latter is a Qaernermiut word. From

[1]) Cf. for this and the following words also Schultz-Lorentzen, passim.
[2]) Parry, p. 565.
[3]) Rink: E. Greenl. Dial., p. 222. — Boas: Dial. Cumberl. S., p. 98.
[4]) Petitot, p. 54.
[5]) Boas: Dial. Cumberl. S., p. 106.
[6]) Gilder, pp. 310, 314.

the Mackenzie River *kʂoyaneʂa*[1]) is given. The Polar Eskimos also sometimes say [qujăn·a're·].

10. [a·p] is the common word in West Greenland. Besides [so·] [so·runa] [ilumut] [măs·ame] are used. From the olden times *am illam* are given[2]). At Aivilik also [a·m-ila·]·[ima·], thus. Hanbury has *tauka*, strictly "thus"[3]).

## Verbs.

1. In Labrador *kiuvoq*, answers[4]).
4. [tus·iarpɔq], prays, in a religious sense, sings hymns, but originally only begs earnestly, entreats[5]).
5. [iluarpɔq], is correct. At Mackenzie River *tchuinaʂk*[6]). Parry's forms *mămā-ĭt-poke* and *mā-mă-ĭn-mut*[7]) only apply to food. Tyrrell writes *pī-tou'-i-kū-ni*[8]); [pitsăk], excellent.

9—10. [qulis·erpa·], boils it over a lamp; [igava·], boils it over heather; [u·p·a·], boils, roasts or bakes it, prepares it with heat.

13. [ni·verpɔq], trades.
16. [pi·vɔq], is useful, [piune·rtita·], lets him become useful.
19. [persɛrpɔq], it (the weather) is drifting (with snow); [persɔrpɔq], the snow is drifting.
20. Poul Egede has *kévlerpok*[9]). Cf. "Tools" Nos. 3—4.
23. Kleinschmidt translates [tivasɔq] "dances with a drum and many antics in order to rouse the laughter of the audience"; Schultz-Lorentzen has also the meaning "beats it wings (a bird)". In the Thule District it is a special manifestation of joy, which consists in holding the drum at the hip and belabouring it very rapidly. Poul Egede has *mumérpok*, mumbles, sings, Petitot from Hudson Bay *mumektok*, song[10]].
25. [at·ɔrpa·], touches it. In Labrador *tapsikpâ*, feels it[11]).

[1]) Petitot, p. 46.
[2]) Bartholin, p. 71. — Anderson, p. 292.
[3]) Hanbury, p. 301.
[4]) Rink: Esk. Tr., p. 123.
[5]) Cf. P. Egede, p. 191. — Anderson, p. 302.

[9]) P. Egede, p. 80.
[10]) Ibidem, p. 110. — Petitot, p. 14.
[11]) Erdmann, p. 314.

26. [ik·e·], exclamation, when touching something cold or wet; [u·lip·ɔq], trembles with cold or fright; [niʟ·Eq], cold.
27. [näk·Arpɔq], falls through the ice, in Labrador breaks through the ice[1]); [qArsɔrsAq], hook.
30. [iluArpɔq], is right; [ajɔrpɔq], is bad; [pi·vɔq], is useful. Gilder has *mah-muk'-poo*, which is only used about food. Petitot *pétçaukuni*[2]); [pitsäk], excellent.
34. Cf. No. 4. [tut·o], caribou; [maqa·p·ɔq], is absent (obsolete). The word occurs with Poul Egede and in Labrador[3]).
35. [qajAq], kayak; [pitArtɔq], acquires something.
42. [tusa·va·], understand it.
45. [uläpisa·t], toy; [qitip·ɔq], is gay, dances.
48. Cf. "Universe and Division of Time" No. 32.
50. [A·rqip·a·], repairs it; cf. No. 5.
51. Cf. No. 50. [nukinis·Arpɔq], exercises his strenght; [mĒn̄ŋuEr-sErpɔq], rests.
54. At Angmagssalik *utdlagpâ*, runs in order to catch him; in Labrador *udlapa*, runs after him[4]).
57. Cf. "Tools" No. 8.
58. Cf. "Tools" No. 8. [saliva·], scrapes hair off skin, at Cumberland Sound: cleans it[5]).
59. Kleinschmidt writes *magssagpoq*, has loosened particles attached to the surface; the word is hardly used; [mäs·äp·a·], loosens a seal skin with the blubber adhering to it[6]).
66. [mikip·ɔq], pulls at it with his teeth, in order to loosen some of it; [a·p·a·], turns (the skin of a small mammal or a bird) inside out.
71. Cf. "Universe and Division of Time" No. 37.
72. [imAq], sea, contents.
75. [tasiva·], stretches it.
76. [unik·A·rpɔq], tells of something (rare word]. Gilder has *kow'-you-yor*[7]).
78. Cf. No. 34. The Pâdlimiut know the word [aul·Arpɔq], but use it rarely, Gasté has *piuktok* i. e. [pihuktɔq], walks, Tyrrell *kak-mal-to*[8]).

79. [kiʟ·ik], border, cause; [tɛqiga·], dares not pronounce the name of a deceased person; [pisäk], strength. In Labrador *pitsartovok* is powerful [1]).
82. [ipe], handle.
85. [sum·ip·ɔq], sniffs as a dog; in Labrador cries inwardly [2]).
